

Aerial-Imagery (Crop-Health Surveillance) Drones

1) Documentation

In this Project, we use an Aerial imagery Drones to inspect Crop-health to save farmers times by giving them a bird's eye view of crops so they can get information about crops so our **Drone component:**

- Drone:

Our Drone is suitable for cover a long-range farm.

- Sensors:

We depend on some sensors to fly and to analysis like (speed and distance Sensor- Infrared and thermal sensors – Image sensors – Lidar -Weather Sensor)

- Camera:

Camera with bird's eye view

- Storage:

Solid state drive 240 GB

- Battery

LiPo Battery with self-charging

Requirements:

- Drone must be charged to perform navigation.
- Drone starts capture the images at range from 100 m to 150 m above the ground.
- Weather must be fine and may fly on rainy weather not on windy and storm weather.
- Mission must be assigned to drone “Scheduled or on demand.”
- Connect drone with phone or laptop to get analysis and photos.

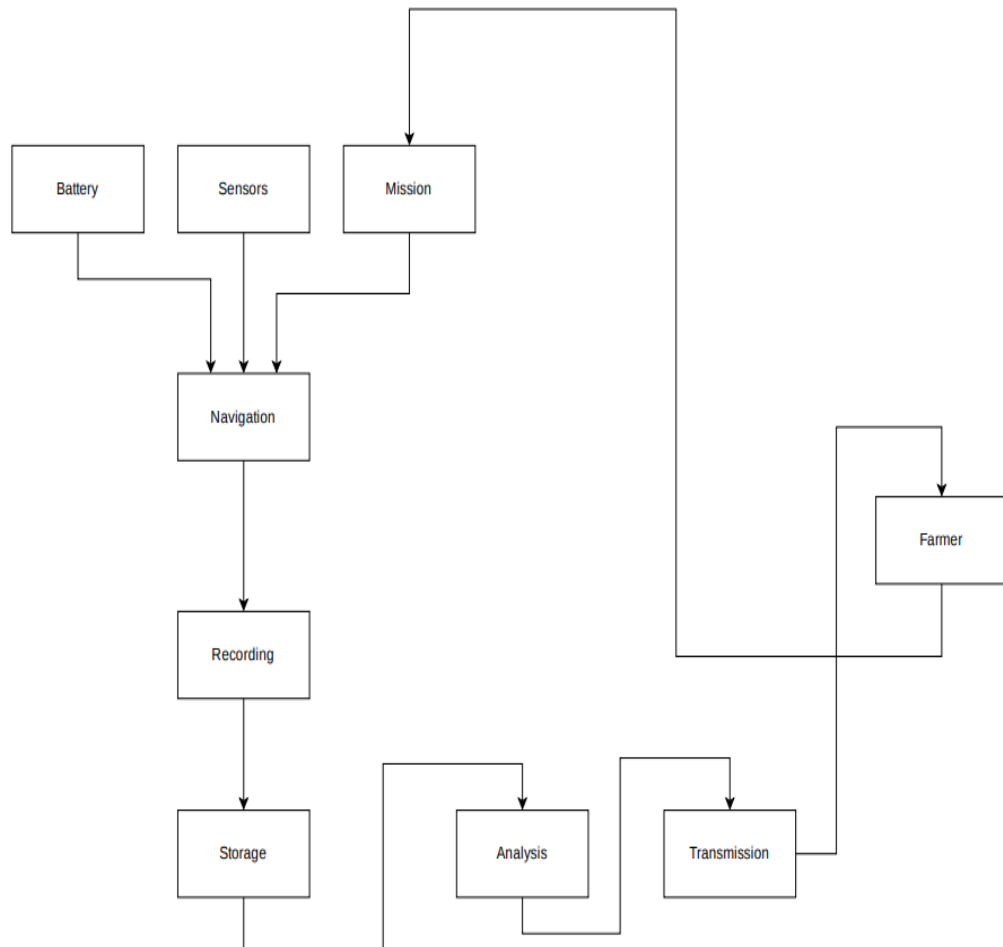

Time Constraints:

	t-min	t-max
Sensors	2ms	5ms
Motor	1 μ s	2 μ s
Take off	1s	2s
Recording	1ms	2ms
Analysis	300ms	900ms
Transmission	1s	3s
Charging	60 s	300 s
Total	62.3 s	306 s

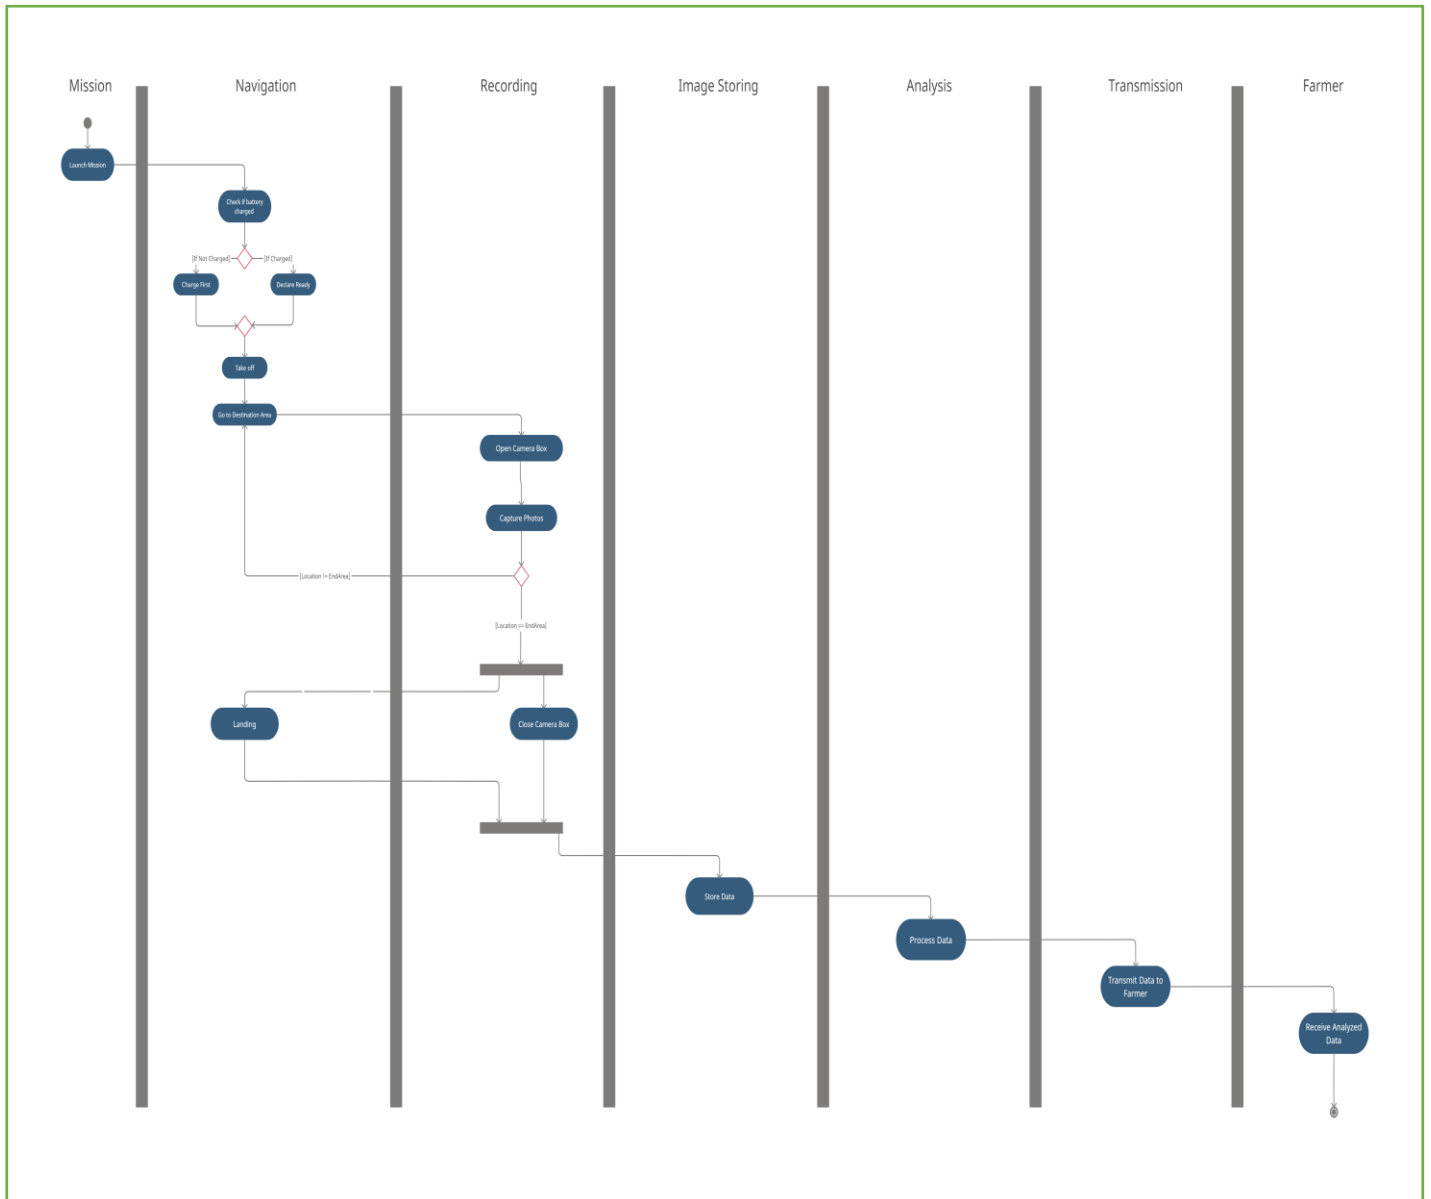

So minimum and maximum time responds of whole system approximately from 1 min to 5 min.

2) Requirements modelling:

- Block Diagram

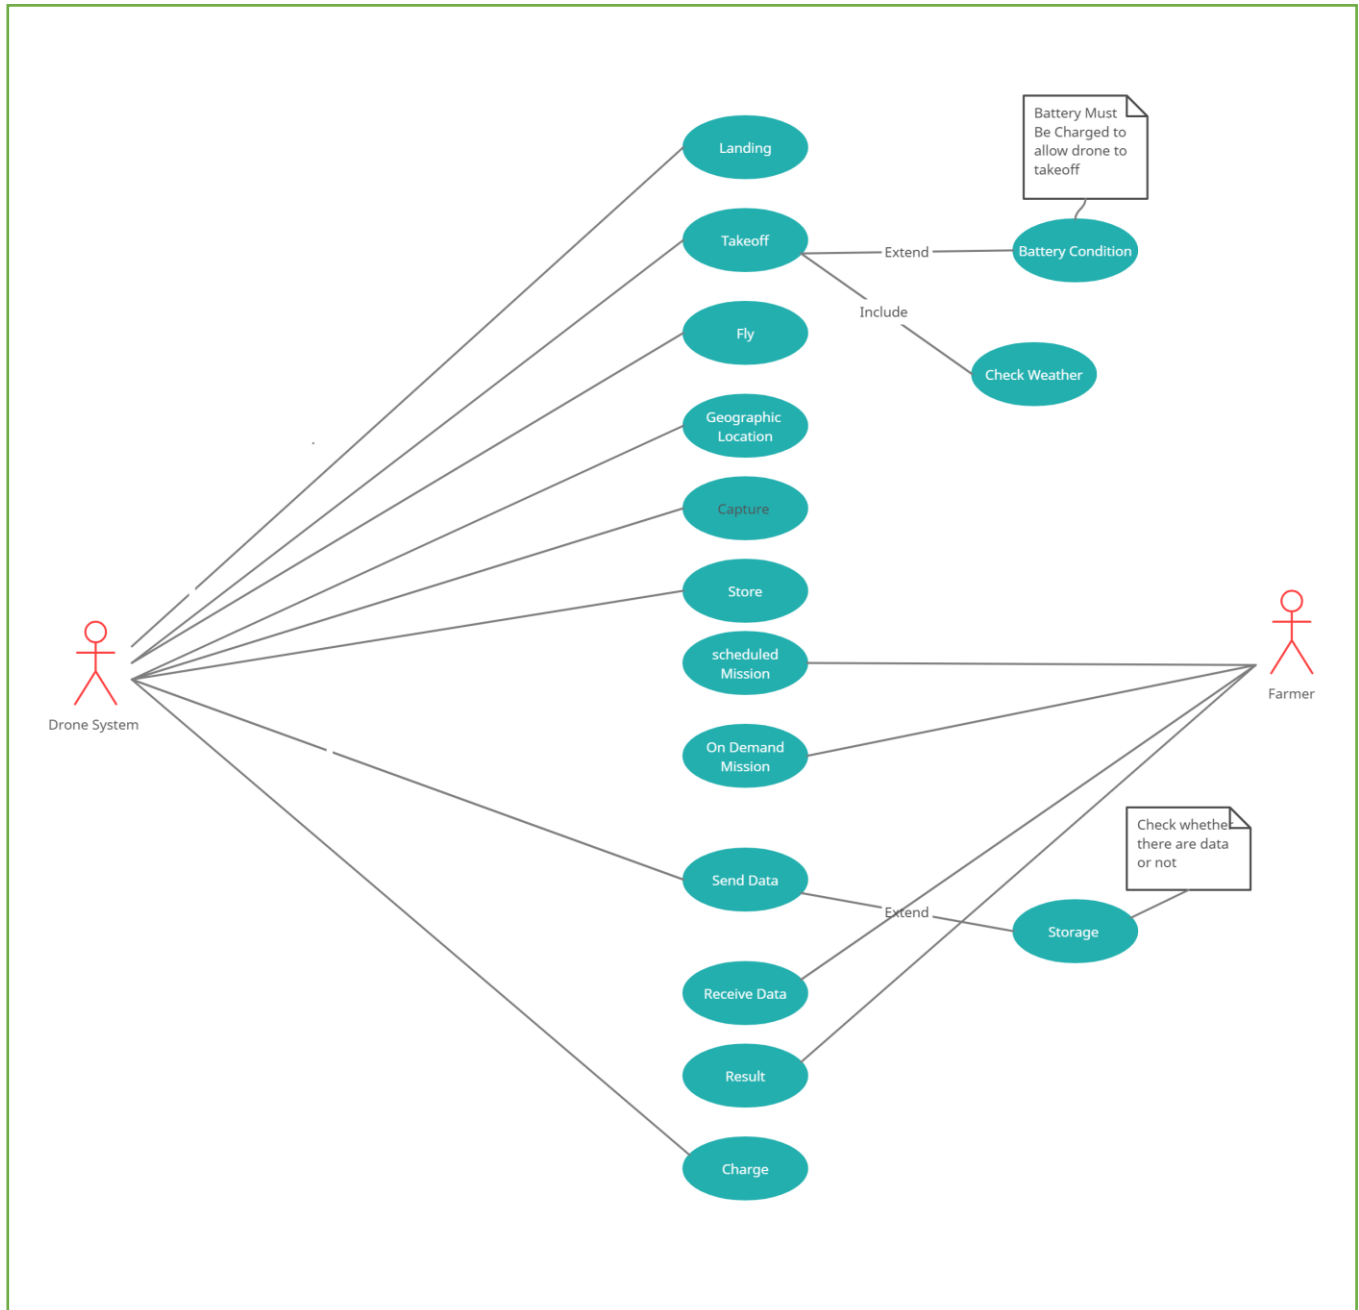

-Activity Diagram

-Use Case Diagram(Using COMET UML profile)

-Requirements Modelling:

Identifier and name		Take-off
Summary	In the beginning, the drone starts to fly under some conditions	
Dependency	1-Battery Condition 2-Weather	
Actors	Drone System	
Precondition	The drone must be charged.	
Postcondition	The drone will take-off and will start to fly.	
Main success Scenario	1. the drone system will check battery condition and if battery is full so it will take off otherwise it won't. 2. The drone must check weather.	
Extensions	1.a-Battery is low. 1.a.1- The Drone will start charging. 2.a- the weather is not good. 2.a.1- the drone will not take off.	
Non-Functional	<ul style="list-style-type: none"> performance requirement: The drone must take off in 5 seconds. 	

Identifier and name		Fly
Summary	The Drone is flying after checking many conditions	
Dependency	None	
Actors	Drone System	
Precondition	Take off	
Postcondition	Drone is flying	
Main success Scenario	1. After taking off, the drone is flying	
alternative	None	
Non-Functional	availability requirement: The drone must be operational all the time of the mission.	

Identifier and name**Capture****Summary**

Drone captures some images to inspect crop health and gathers crop stress data

Dependency

Camera and Storage

Actors

Drone System

Precondition

The drone must be in the specified location.

Postcondition

The drone captures some images and store it.

Main success Scenario

1. The drone is in the specified location.
2. It covers a specified area.
3. It captures images for the crops.
4. It stores the images.

alternative

None

Non-Functional

1. performance requirement: the images must be clear with details.

Identifier and name		Store
Summary	A function which stores the captured images to send it later to the farmer.	
Dependency	None.	
Actors	Drone System	
Precondition	Some images must be captured.	
Postcondition	Captured images will be stored.	
Main success Scenario	<ol style="list-style-type: none"> 1. Drone will capture some images. 2. It will store it to send it later. 	
alternative	None	
Non-Functional	None	

Identifier and name		Send Data
Summary	The drone sends captured images to the farmer to analyse it.	
Dependency	Whether there are data or not(Storage).	
Actors	Drone System	
Precondition	The drone must capture images for crops	
Postcondition	The drone will send those images of the crops to the farmer	
Main success Scenario	1. The drone will send captured images to the farmer	
alternative	There are no data(images) to be send.	
Non-Functional	None	

Identifier and name		Receive Data
Summary	The drone will capture some images and send it to the farmer so we will use this function to receive these data	
Dependency	Storage	
Actors	Farmer	
Precondition	Images will be stored in drone system	
Postcondition	The drone system will send those images to the farmer	
Main success Scenario	<ol style="list-style-type: none"> 1. The Drone will store data. 2. It will send these data to the farmer. 3. The farmer will receive these data to inspects crop health and gathers crop stress data. 	
alternative	Images are not sent	
Non-Functional	None.	

Identifier and name		Scheduled Mission	
Summary	The farmer may schedule mission for the drone system.		
Dependency	The farmer		
Actors	Farmer		
Precondition	None		
Postcondition	A scheduled mission will be added to the drone system		
Main success Scenario	The farmer will schedule a mission.		
alternative	None		
Non-Functional	None		

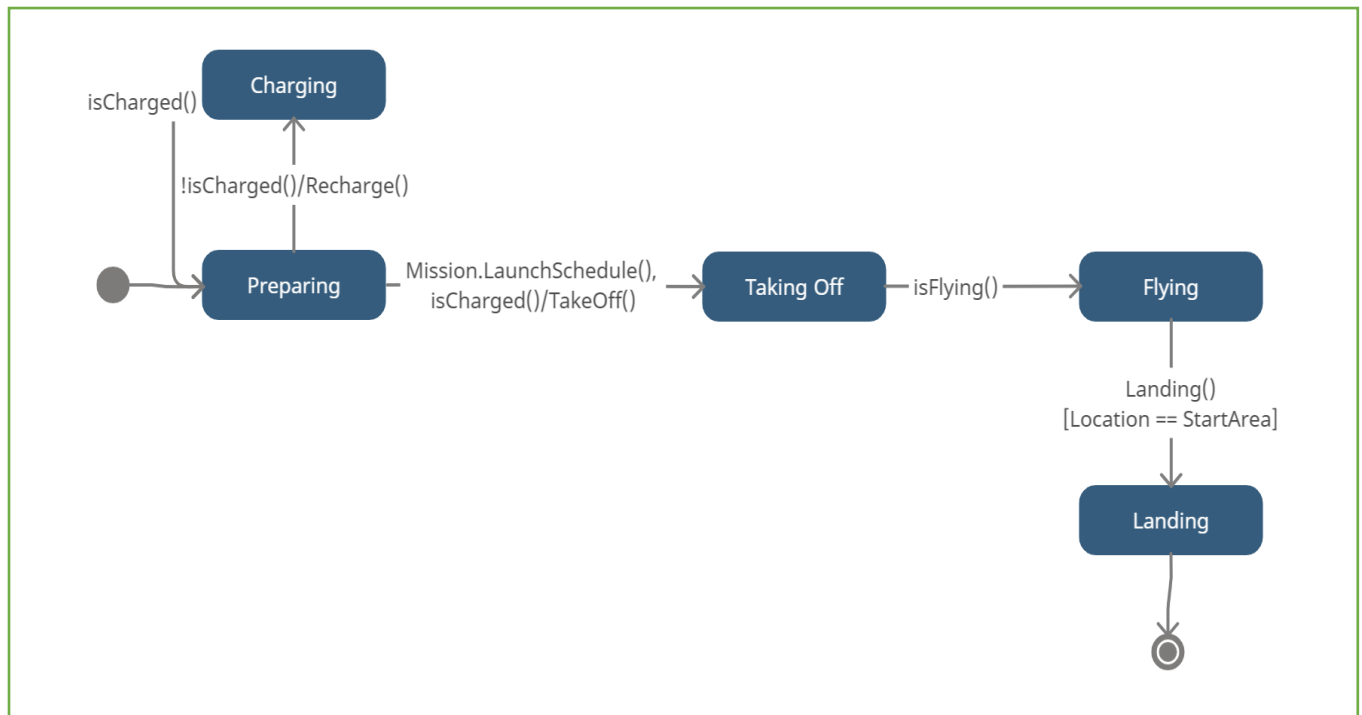

Identifier and name		On Demand Mission
Summary	The farmer may make a “On Demand Mission” for the drone system	
Dependency	Farmer	
Actors	Farmer	
Precondition	None	
Postcondition	“On Demand Mission” will be made for the drone system	
Main success Scenario	The farmer will make a “On Demand Mission” for the drone system	
alternative	None	
Non-Functional	None	

Identifier and name		Result
Summary	It is the result of the analysis which the farmer will make it.	
Dependency	Drone images and the analysis.	
Actors	Farmer	
Precondition	Analysis.	
Postcondition	The farmer will be able to know the reasons for the stress which decrease crop yields.	
Main success Scenario	4. Analysis 5. Result of this analysis. 6. The farmer will make actions.	
alternative	None	
Non-Functional	performance requirement: High Accuracy	

Identifier and name		Landing
Summary	Function to land the drone after finishing its work.	
Dependency	Scheduled mission or On Demand missions.	
Actors	Drone System.	
Precondition	Scanning the area, capturing images and sending them to the farmer.	
Postcondition	Turn off	
Main success Scenario	1.fininshing its work. 2.Returns to its box.	
alternative	None	
Non-Functional	Performance requirements: Time Accuracy.	

-State Machine Diagram & Stimuli/response Identification

Navigation State chart diagram

Stimuli: Flying Drone

Response: Charging, Flying , Landing

State(current)/State(next)	Preparing	Charging	Taking off	Flying	Landing
Preparing	_____	Recharge() /Charging	Mission Lunched/ Takeoff	_____	_____
Charging	Is Charged=true / Prepare	_____	_____	_____	_____
Taking off	_____	_____	_____	Flying/fly	_____
Flying	_____	_____	_____	_____	Landing/land
Landing	_____	_____	_____	_____	_____

Transmission State Chart Diagram

Stimuli: Transfer image and analyzed data

Response: transmit data to farmer

State(current)/State(next)	Receive Analyzed Data	Transmitting
Receive Analyzed Data	_____	send Data/ data transmitted to farmer
Transmitting	_____	_____

Recording State Chart

Stimuli: Open Camera and recording

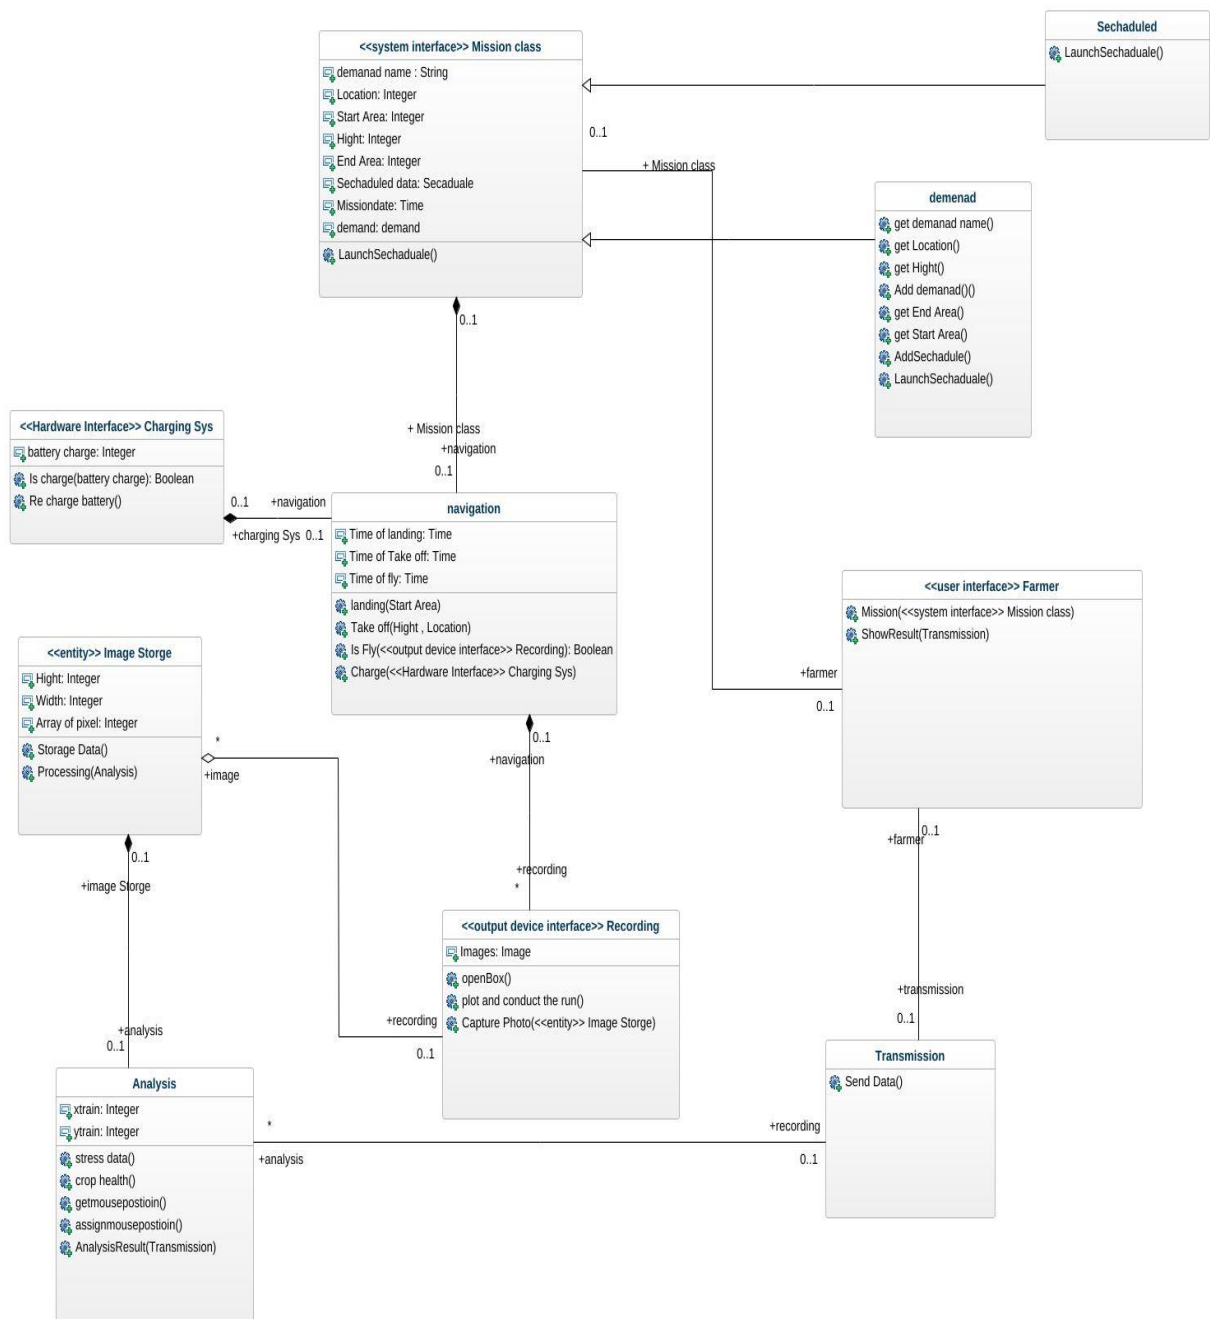

Response: Recording and store images

State(current)/State(next)	Not Recording	Recording	Storing Date
Not Recording	_____	Is flying==true / Open Camera box and record	_____
Recording	_____	_____	Store Date/save data in storage
Storing Date	_____	_____	_____
